Brachial Plexus Injury Awareness

"Bring Brachial Plexus Injuries to Light"

What are brachial plexus injuries? The brachial plexus is a network of nerves that control the muscles of the shoulder, arm and hand. Injury to the brachial plexus can result in full to partial paralysis of one or both arms. Stretching, tearing and other trauma can cause this type of injury. Brachial plexus injuries often occur during the birthing process. Availability of brachial plexus statistics vary widely, but where figures are available the general consensus is that brachial plexus injuries occur in 2-5 out of 1000 births. Other causes include automobile, motorcycle, or boating accidents; gunshot or puncture wounds; sports injuries (called "burners" or "stingers"); due to specific medical treatments / procedures / surgeries; or due to viral causes.

How can I learn more? Start your search by visiting the website of the United Brachial Plexus Network, Inc. (UBPN) at www.ubpn.org for support, information, and links to other resources. Their phone is 781-315-6161
